Exercícios Cap 05

Rodrigo Giannotti

Capitulo 05

Inicialização

```
library(tidyverse)
library(magrittr) # mais pipes, como %<>%
library(lubridate) # melhor manejo de datas
```

Para o capitulo 5 também utilizaremos a biblioteca de voos de NYC

```
library(nycflights13)
# ?flights
# View(flights)
head (flights)
```

```

Exercícios

5.2 filter()

5.2.1

Find all flights that:

a Had an arrival delay of two or more hours

```
flights %>% filter(
  arr_delay >= 120
)
```

```

#

Another useful dplyr filtering helper is between(). What does it do? Can you use it to simplify the code needed to answer the previous challenges?

?between

Como dito na ajuda, "This is a shortcut for x >=left & x <=right" ou seja, é uma maneira de testar se valores dentro de um vetor estão dentro de dois limites.

Isso só seria útil para simplificar a questão dos meses do verão

```
flights %>% filter(
  between(month, 7, 9)
)
```

```

                  1
## 10 2013
                  1
                        2
                                 NA
                                                1545
                                                              NA
                                                                        NA
                                                                                       1910
## # ... with 8,245 more rows, and 11 more variables: arr_delay <dbl>,
```

carrier <chr>, flight <int>, tailnum <chr>, origin <chr>, dest <chr>,
air_time <dbl>, distance <dbl>, hour <dbl>, minute <dbl>, time_hour <dttm>

Podemos ver que os voos com dep_time vazio apresentam outras colunas vazias, como dep_delay; arr_time; arr_delay; e air_time

Isso muito provavelmente indica voos que foram cancelados

5.2.4

Why is NA $\hat{}$ 0 not missing? Why is NA | TRUE not missing? Why is FALSE & NA not missing? Can you figure out the general rule? (NA * 0 is a tricky counterexample!)

```
# help(`^`)
# help(`|`)
```

Como podemos ver no texto de ajuda "1 ^ y and y ^ 0 are 1, always.", dessa forma o operador nem passa pela etapa de avaliar o NA, simplesmente retornando o resultado.

Similarmente, "NA is a valid logical object. Where a component of x or y is NA, the result will be NA if the outcome is ambiguous. In other words NA & TRUE evaluates to NA, but NA & FALSE evaluates to FALSE. See the examples below."

Logo como sempre (x | TRUE) retornaria TRUE e (x & FALSE) retornaria FALSE independentemente dos valores de x, logo retornam-se os valores lógicos.

Isso só ocorre quando o computador está explicitamente tomando a decisão de não avaliar a expressão como um todo, devido à um de seus lados. não existe tão decisão para NA * 0, por exemplo, logo o resultado esperado é NA.

```
NA * O
```

[1] NA

5.3 arrange()

5.3.1

How could you use arrange() to sort all missing values to the start? (Hint: use is.na().)

```
flights %>% arrange(
  desc(
    is.na(dep_time)
  ))
## # A tibble: 336,776 x 19
                     day dep_time sched_dep_time dep_delay arr_time sched_arr_time
##
       year month

5.4 select()

5.4.1

Brainstorm as many ways as possible to select dep_time, dep_delay, arr_time, and arr_delay from flights.

Por mais que uma partida de regex golf sempre tenha seu valor nostalgico a função starts_with() resolve o problema com mais simplicidade

```
flights %>% select(
  starts_with("dep_"
) |
  starts_with("arr_"
)
)
```

```
## # A tibble: 336,776 x 4

## 10
           558
                     753
## # ... with 336,766 more rows
```

Somente uma copia dessa coluna chega ao resultado final

5.4.3

What does the one_of() function do? Why might it be helpful in conjunction with this vector?

```
vars <- c(
  "year", "month", "day", "dep_delay", "arr_delay"
)
# ?tidyselect::one_of</pre>
```

Como podemos ver o próprio tidyverse sugere o uso das mais precisas all_of() ou any_off(), que servem para - em conjunto com o comando select() selecionar variáveis com nomes dentro de listas. o comando all_of retorna erro se algum dos nomes da lista não for encontrado como nome de coluna enquanto o any_off ignora as colunas que não forem encontradas. No caso ambos devem retornar o mesmo dataframe, visto que todas as colunas da lista existem.

```
flights %>% select(
  any_of(
    vars
)
)
```

```
## # A tibble: 336,776 x 5

## # ... with 336,766 more rows
# ?select
```

Isso não surpreende, mas poderia ser interessante esperar que o helper "contains()" considerasse caixa baiza ou alta. Para mudar seu comportamento para que passe a considerar isso basta usar o argumento ignore.case = FALSE

```
flights %>% select(
  contains(
    "TIME", ignore.case = F
  )
)
```

A tibble: 336,776 x 0

5.5 mutate()

5.5.1

Currently dep_time and sched_dep_time are convenient to look at, but hard to compute with because they're not really continuous numbers. Convert them to a more convenient representation of number of minutes since midnight.

```
(flights2 <- flights %>% mutate(
  dep_time_mins = (dep_time %/% 100) * 60 + dep_time %% 100,
  sched_dep_time_mins = (sched_dep_time %/% 100) * 60 + sched_dep_time %% 100
))

## # A tibble: 336,776 x 21

## 10 2013
                  1
                         1
                                 558
                                                  600
                                                               -2
                                                                        753
                                                                                         745
```

^{## # ...} with 336,766 more rows, and 13 more variables: arr_delay <dbl>,

^{## #} carrier <chr>, flight <int>, tailnum <chr>, origin <chr>, dest <chr>,

^{## #} air_time <dbl>, distance <dbl>, hour <dbl>, minute <dbl>, time_hour <dttm>,

^{## #} dep_time_mins <dbl>, sched_dep_time_mins <dbl>

Compare air_time with arr_time - dep_time. What do you expect to see? What do you see? What do you need to do to fix it?

Primeiro vamos dar o mesmo tratamento que demos para os horários de saída para os horários de chegada

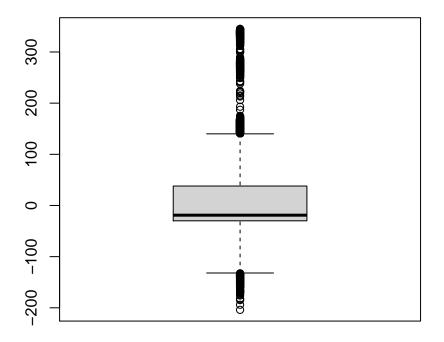

```
flights2 %<>% mutate(
  sched_arr_time_mins = (sched_arr_time %/% 100) * 60 + sched_arr_time %% 100,
  arr_time_mins = (arr_time %/% 100) * 60 + arr_time %% 100
)
```

Com isso vamos criar uma nova coluna, que compara o horário efetivo de saída com o de chegada, tomando alguns cuidados, especialmente com voos que saem em uma data e chegam em outra. Supoe-se que nenhum voo voa por mais de 24h nesse caso (e uma rápida olhada para a coluna air_time confirma isso)

```
flights2 %<>% mutate(
    arr_dep_time_diff = ifelse(
        arr_time_mins >= dep_time_mins, # se o voo chegou no dia seguinte a conta arr_time - dep_time daria
        arr_time_mins - dep_time_mins, # caso não hajam problemas
        arr_time_mins - dep_time_mins + 24*60) # adicionando o numero de minutos em um dia caso o voo tenha
)
```

Agora vamos comparar a diferença entre horário de saída com a coluna air time

```
flights2 %>%
  na.omit() %>%
  mutate(
  comparacao =
    air_time - arr_dep_time_diff
) %>%
  select(comparacao) %>%
  boxplot()
```

```
flights2 %>%
  na.omit() %>%
  mutate(
  comparacao =
    air_time - arr_dep_time_diff
) %>%
  select(comparacao) %>%
  summary()
```

comparacao ## ${\tt Min.}$:-204.00 ## 1st Qu.: -30.00 ## Median : -19.00 ## Mean : 13.38 ## 3rd Qu.: 38.00 Max. : 345.00

Esperaria-se que essa comparação fosse sempre igual a 0, visto que se espera que o tempo de voo se iguale à diferença de hora de saída e hora de chegada, o problema é que neste caso estamos ignorando o tempo de taxi e que existam imperfeições de registro. (poderiamos ter questoes de fuso horario, mas ?flights nos informa que todos os horarios estão na timezone de NYC)

Compare dep_time, sched_dep_time, and dep_delay. How would you expect those three numbers to be related?

```
flights2 %>% mutate(
  comparison = ifelse(
    dep_time_mins >= (sched_dep_time_mins + dep_delay),
    dep_time_mins - (sched_dep_time_mins + dep_delay),
    dep_time_mins - (sched_dep_time_mins + dep_delay) + 24*60
    )) %>%
  select(comparison) %>%
  summary()
```

```
## comparison
## Min. :0
## 1st Qu.:0
## Median :0
## Mean :0
## 3rd Qu.:0
## Max. :0
## NA's :8255
```

Esperaria-se que essa comparação retornasse valor nulo, o que confirmamos com o comando summary()

Find the 10 most delayed flights using a ranking function. How do you want to handle ties? Carefully read the documentation for min_rank().

```
flights %>%
  mutate(
  rank_delay = min_rank( desc(
      arr_delay + dep_delay
))) %>%
  arrange(rank_delay) %>%
  filter(rank_delay <= 10)</pre>

## # ... with 12 more variables: arr_delay <dbl>, carrier <chr>, flight <int>,
       tailnum <chr>, origin <chr>, dest <chr>, air_time <dbl>, distance <dbl>,
## #
       hour <dbl>, minute <dbl>, time_hour <dttm>, rank_delay <int>
# ?rank
```

Por sorte não temos empates usando essa formula, mas se tivessemos por usar a forma min_rank teriamos que empates teriam o mesmo rank, este sendo o minimo entre eles.

What does 1:3 + 1:10 return? Why?

```
1:3 + 1:10
```

 $\mbox{\tt \#\#}$ Warning in 1:3 + 1:10: longer object length is not a multiple of shorter object $\mbox{\tt \#\#}$ length

[1] 2 4 6 5 7 9 8 10 12 11

a lógica é 1+1 2+2 3+3 e então, como a lista menor acaba temos 1+4 2+5 3+6 1+7 2+8 3+9 1+10 E um aviso informando que a lista maior não tem uma quantidade de itens multipla da quantidade de itens na lista menor.

What trigonometric functions does R provide?

?sin

O texto de ajuda das funções trigonometricas lista as seguintes: "These functions give the obvious trigonometric functions. They respectively compute the cosine, sine, tangent, arc-cosine, arc-sine, arc-tangent, and the two-argument arc-tangent.

5.6 summarise()

Para essa seção em alguns exercícios utilizaremos uma tabela com os voos que foram cancelados.

```
not_cancelled <- flights %>%
filter(!is.na(dep_delay), !is.na(arr_delay))
```

5.6.1

Brainstorm at least 5 different ways to assess the typical delay characteristics of a group of flights. Consider the following scenarios:

- **a** A flight is 15 minutes early 50% of the time, and 15 minutes late 50% of the time.
- **b** A flight is always 10 minutes late.
- \mathbf{c} A flight is 30 minutes early 50% of the time, and 30 minutes late 50% of the time.
- **d** 99% of the time a flight is on time. 1% of the time it's 2 hours late.
- e Which is more important: arrival delay or departure delay?

5.6.2

Come up with another approach that will give you the same output as not_cancelled %>% count(dest) and not_cancelled %>% count(tailnum, wt = distance) (without using count()).

```
identical(
  not_cancelled %>% count(dest),
  not_cancelled %>%
    group_by(dest) %>%
    summarise(n = n(), .groups = 'drop')
)

## [1] TRUE
identical(
  not_cancelled %>% count(tailnum, wt = distance),
  not_cancelled %>%
    group_by(tailnum) %>%
    summarise(n = sum(distance), .groups = 'drop')
)
```

[1] TRUE

5.6.3

Our definition of cancelled flights (is.na(dep_delay) \mid is.na(arr_delay)) is slightly suboptimal. Why? Which is the most important column?

Primeiro, vamos olhar para a coluna com a maior quantidade de NAs

flights %>% filter(is.na(arr_delay))

```
##
  # A tibble: 9,430 x 19

## #
       air_time <dbl>, distance <dbl>, hour <dbl>, minute <dbl>, time_hour <dttm>
```

Encontramos alguns voos com horário de saída, horário de chegada, mas nem tempo de voo nem atraso de chegada.

É difícil saber como considerar se estes voos foram ou não cancelados, mas me parece que o mais correto seria considerar um voo cancelado como aquele que não decolou, e portanto, tem dep_time == NA

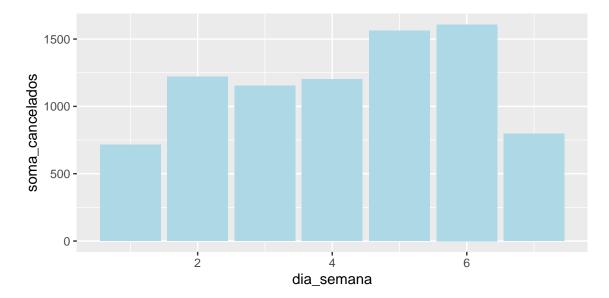

5.6.4

Look at the number of cancelled flights per day. Is there a pattern? Is the proportion of cancelled flights related to the average delay?

É de se imaginar que se existe algum padrão de cancelamentos ou atrasos estes se dariam em datas especiais ou em dias da semana mais comuns. Para isso usando a coluna time_hour e o pacote lubridate podemos criar colunas para ter mais insights sobre esses padrões.

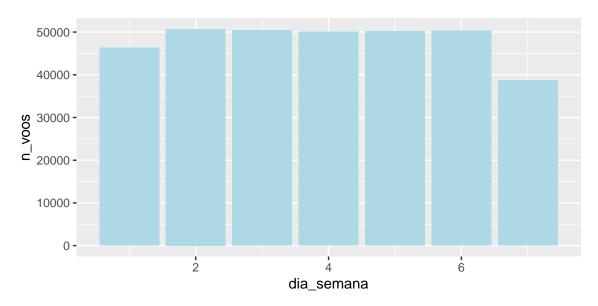

```
flights3 <- flights %>%
  mutate(dia_semana = lubridate::wday(time_hour))

flights3 %>%
  group_by(dia_semana) %>%
  summarise(soma_cancelados = sum(is.na(dep_time)), .groups = "drop") %>%
  ggplot(mapping = aes(x = dia_semana, y = soma_cancelados)) +
  geom_col(fill = "lightblue") # voos cancelados por dia da semana
```

Primeiro podemos ver que muito menos voos foram cancelados durante o fim de semana, mas será que existe uma correlação com o número total de voos nesses dias?

```
flights3 %>%
  group_by(dia_semana) %>%
  summarise(n_voos = n(), .groups = "drop") %>%
  ggplot(mapping = aes(x = dia_semana, y = n_voos)) +
  geom_col(fill = "lightblue") # voos totais por dia da semana
```

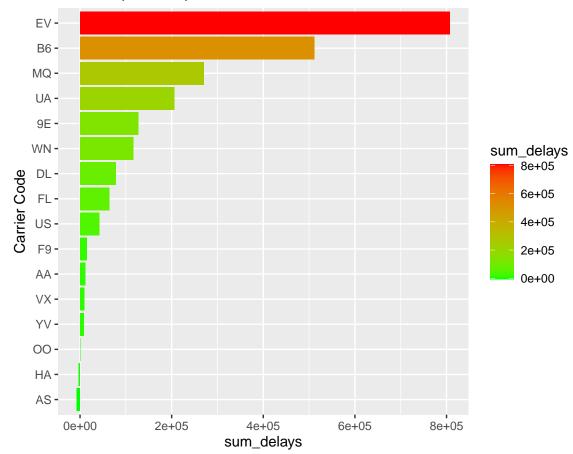

Por mais que realmente existam menos voos marcados durante fins de semana parece que muitos mais são cancelados durante a semana do que em fins de semana.

5.6.5

Which carrier has the worst delays? Challenge: can you disentangle the effects of bad airports vs. bad carriers? Why/why not? (Hint: think about flights %>% group_by(carrier, dest) %>% summarise(n()))

Para essa Análise me parece o mais razoável analizar somente o arr_delay, visto que por mais chato que seja ficar aguardando no aeroporto no final o que mais importa é se o avião chega ao seu destino final no horário, para os passageiros.

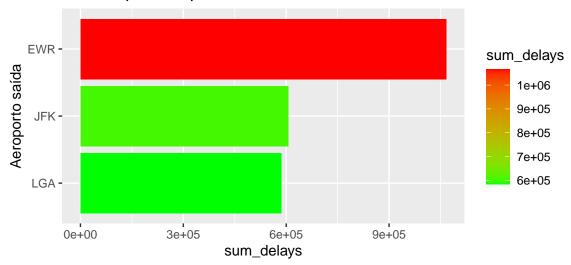

Atrasos por companhia, soma

Por mais bonito que o gráfico possa ficar o mais justo seria considerar o atraso médio, não o total de atrasos no período (ou ainda vale pensar qual a medida estatística mais adequada, por exemplo uma medida mais robusta poderia ser mais interessante para o passageiro médio).

Feitas essas considerações seguimos com o exercício.

Atrasos por aeroporto, soma

É bastante evidente que as companhias que mais voam de EWR inevitavelmente incorrerão em mais atrasos na média.

Poderiamos tentar um score que ponderasse o atraso médio dos aeroportos na avaliação das companhias aéreas, mas ainda assim é possível argumentar que as responsáveis pelos atrasos nos aeroportos sejam as companhias que lá mais operam.

5.6.6

What does the sort argument to count() do. When might you use it?

?count

O arguimento sort, se == TRUE fará com que na saída da função count() os maiores grupos estarão no topo, ordenados.

5.7 grouped mutates (and filters)

5.7.1

Refer back to the lists of useful mutate and filtering functions. Describe how each operation changes when you combine it with grouping.

5.7.2

Which plane (tailnum) has the worst on-time record?

5.7.3

What time of day should you fly if you want to avoid delays as much as possible?

5.7.4

For each destination, compute the total minutes of delay. For each flight, compute the proportion of the total delay for its destination.

5.7.5

Delays are typically temporally correlated: even once the problem that caused the initial delay has been resolved, later flights are delayed to allow earlier flights to leave. Using lag(), explore how the delay of a flight is related to the delay of the immediately preceding flight.

5.7.6

Look at each destination. Can you find flights that are suspiciously fast? (i.e. flights that represent a potential data entry error). Compute the air time of a flight relative to the shortest flight to that destination. Which flights were most delayed in the air?

5.7.7

Find all destinations that are flown by at least two carriers. Use that information to rank the carriers.

5.7.8

For each plane, count the number of flights before the first delay of greater than 1 hour.
